

Bambus | Bamboo

Bamboo - the resource-efficient and sustainable parquet alternative

The most compelling argument for bamboo parquet flooring is sustainability. Unlike deforestation, cutting down a bamboo plant does not mark its end. The plant is so robust and has such a large root system that allows for the regrowth of bamboo shoots. Bamboo grows so rapidly that large quantities can be harvested at short intervals.

Installation examples from Migora

Widespread in Asia for good reason but relatively rare in Europe: the raw material bamboo. In fact, the Asian grass offers numerous advantages, making it increasingly popular here. It's not surprising that bamboo is making its way into our interiors more and more. The processing of bamboo plants into parquet flooring is particularly attractive.

As professionals in parquet and flooring, we have been observing this trend for a long time. With years of experience and a clear conscience, we can recommend bamboo parquet to our customers. When bamboo fibers are processed into parquet, an extremely robust, durable, and hygienic flooring is created, which also visually convinces. Learn here everything about the sensible alternative to wooden parquet!

Certificates

Since 2008, expert opinions from specialists have confirmed the bamboo flooring's suitability for use with underfloor heating. Additionally, bamboo flooring is certified to have higher hardness compared to oak flooring, attesting to its increased robustness and durability.
